

Pond Treatment

Pond Dye and Biological Clarifier

Pond Treatment enhances the natural aesthetics of the pond through improved clarity and sparkling blue water. The potent bacterial strains accelerate digestion of floating pond debris and reduce accumulated sludge and muck.

Features

Clear aqua blue color
 Filters sunlight for cleaner water

Available In

30- 8 oz. Pouches Item #PLP500P35

Directions for Use

Apply Pond Treatment directly into water. The pouch is water soluble so no scooping or measuring is required. Dyes disperse within hours by natural water movement. Add 1 pound of product per acre, increasing dosing as necessary to achieve desired effect. Water flow and sunlight will determine how long the blue dye lasts in your pond or lake. Repeat dosing every four to six weeks as necessary to maintain desired blue tint.

Pond Treatment can depress dissolved oxygen levels initially, especially in ponds or lagoons with high organic content. Pond Treatment is non-hazardous, but it is advisable to wear rubber gloves and protect clothing during application to prevent stains.

Best results obtained in ponds with ten foot depths or greater. Shallow waters may experience intense blue coloring.

Tech Specs

Bacteria Count	5 Billion CFU per gram
Bacterial Type	Non-pathogenic microbes
DSL	Yes
Color	Blue
Fragrance	None
Gram Negatives	Not present
pH	N/A
Temperature Range	20 - 40 Celsius
Warranty	2 Year
Storage Temperature	10 - 20 Celsius
Storage Humidity	30 - 60%
